

# WHAT IS A CONTAINER?

Lunch and Learn series - *remote edition*

**Nick Brandaleone**

**AWS Specialist SA - Containers**

# GROUND RULES

- ▶ Ask questions
- ▶ Try to be on **mute** when not asking questions
  - ▶ I will be moving quickly
- ▶ <https://github.com/nbrandaleone/what-is-a-container>
  - ▶ I will be using Cloud-9 (Ubuntu OS) for a demo

# AGENDA

## LESSON

## TIME

---

**Why are containers so popular?**

**5 minutes**

---

**What is the magic?**

**5 minutes**

---

**Demo, using BASH**

**20 minutes**

---

**Firecracker demo**

**5 minutes**

# WHY SO POPULAR?

- ▶ **Code portability issue is solved**
- ▶ **Faster start-up time makes them preferable to VMs**
- ▶ **Greater hardware efficiency makes them cheaper**
- ▶ **Isolation provides security (*not perfect though*)**
  - ▶ **Docker tooling is *easy to use***

# WHAT IS THE MAGIC?

CONTAINERS DO NOT **REALLY** EXIST

- ▶ Namespaces
- ▶ cgroups (Linux capabilities + Seccomp)
  - ▶ COW or layered filesystem

*Linux* Kernel tricks - Windows should use .Net Core

# NAMESPACES

**CGROUP** - limit cpu/memory for a group of processes.

**MNT**: It allows a process to have its own filesystem.

**PID**: The pid namespace gives a process its own view of /proc.

**NET**: Isolated network stack.

**UTS**: System's hostname and domain name.

**USER**: The user namespace maps the uids to different uids.

**IPC**: message queues and shared memory.

# CGROUPS

**Where namespaces isolate a process, `cgroups` enforce fair resource sharing between processes.**

**For example:**

- how much memory a process can use**
  - how much CPU can a process use**
- how many children processes can be spawned**

# LAYERED FILESYSTEM

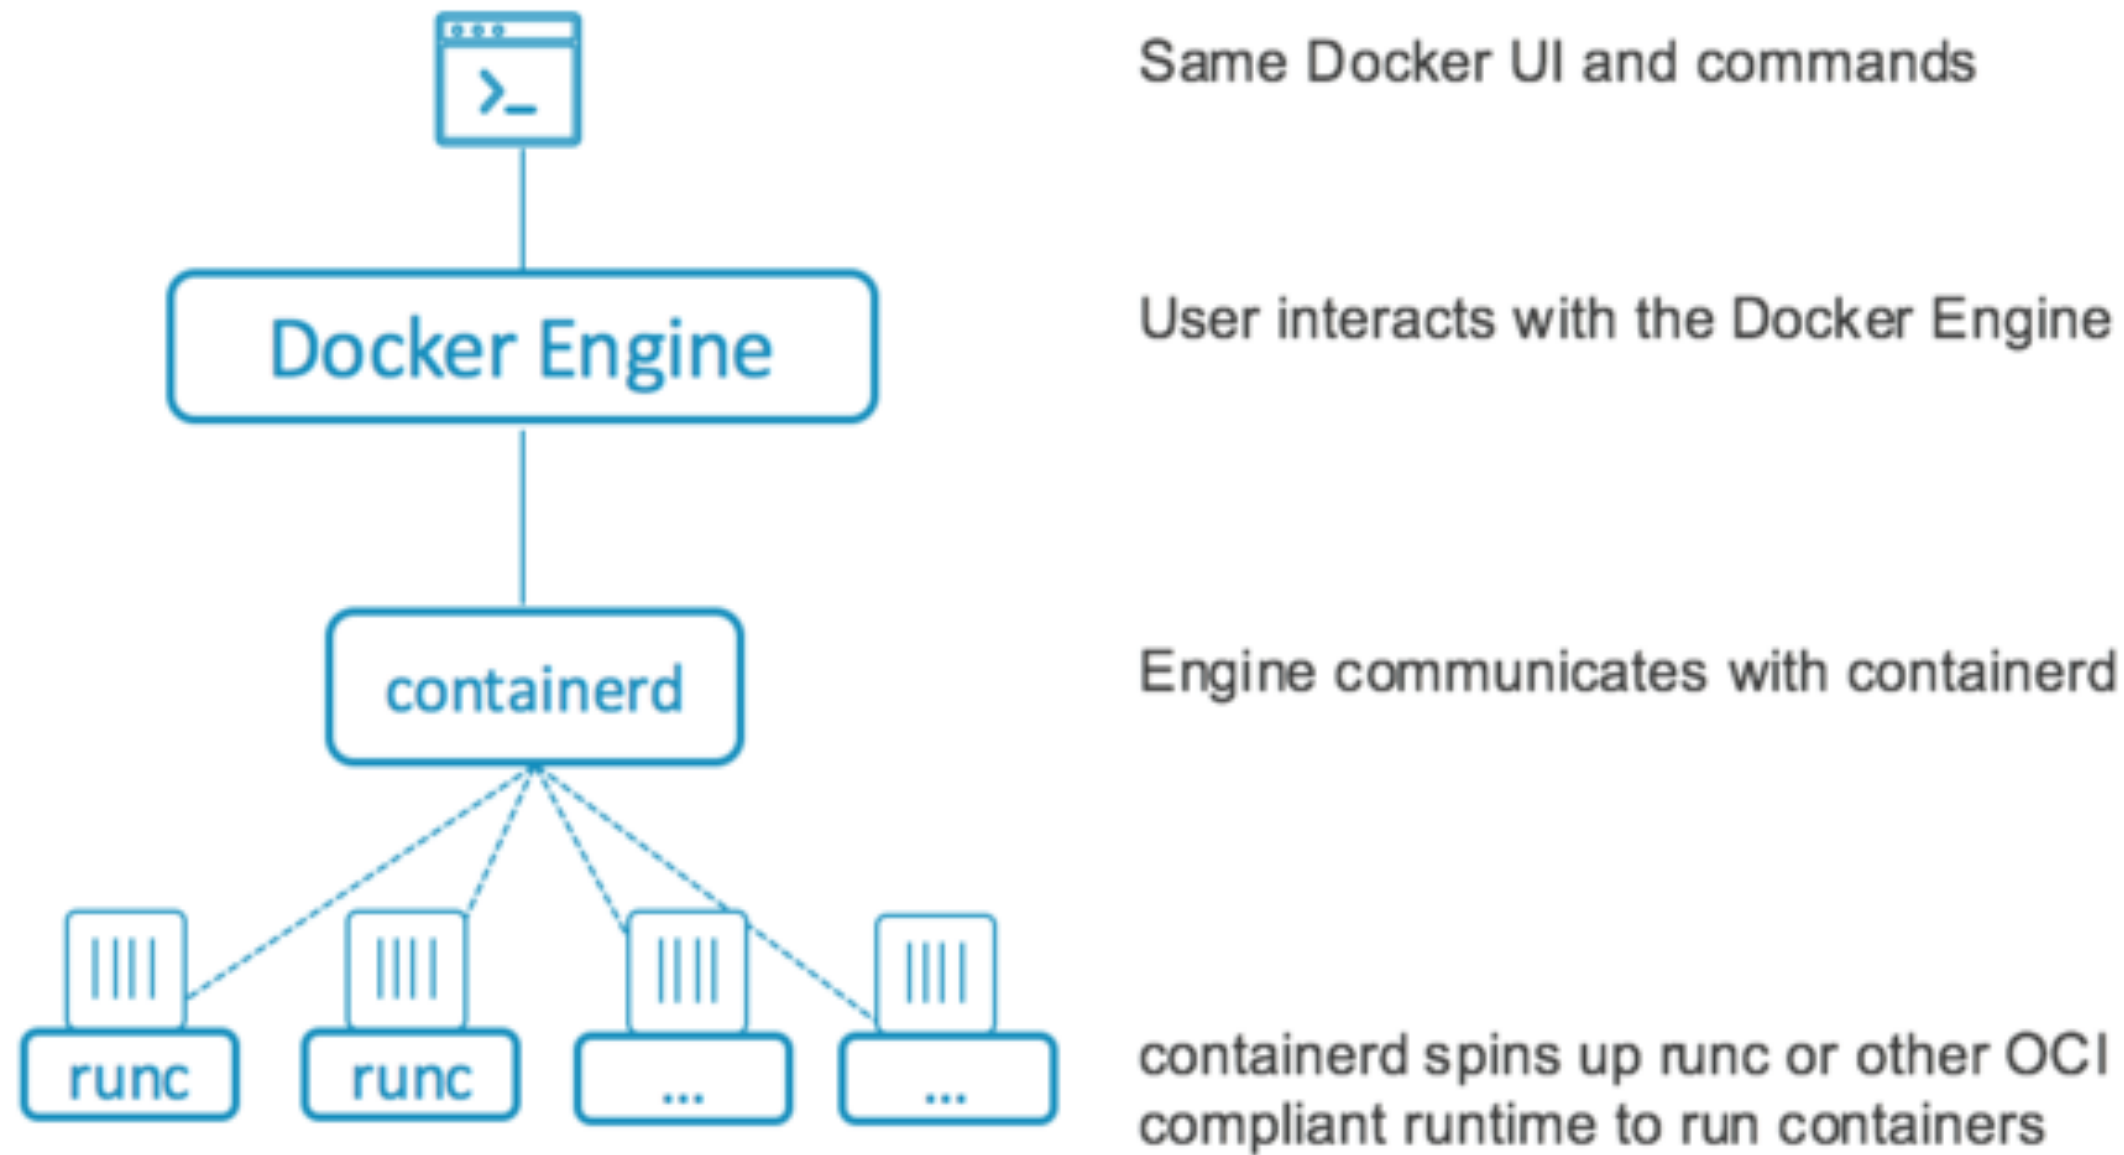

- ▶ **Layered Filesystems are how we can efficiently move whole machine images around.**
  - ▶ **Also known as tarballs...**
    - ▶ **Storage Drivers:**
      - ▶ **overlay2**
      - ▶ **aufs (older version)**

# VOCABULARY

- ▶ **Docker -> the company that made it easy to use containers.  
Purchased by Mirantis in late 2019.**
- ▶ **OCI -> The open source components of Docker**
  - ▶ **containerd (high-level interface)**
    - ▶ **runc (low level)**

# HOW THEY FIT TOGETHER

# UNDER THE HOOD

No `fork()` and `exec()`

We now `clone()` or `unshare()`

**DOCKER AND KUBERNETES ARE WRITTEN IN GO, NOT C**

# DEMO TIME!

12 – June 12, 2020

# THANK YOU

*Stay Safe and Sane*
